PART -A

1. Given a list of numbers, write a Python program to find the third largest element
   Do not use predefined functions like `max()`
2. Write a Python program to count how many elements are present in a list
3. Given a number, write a program to check whether it is even or odd.
4. Write a program to find the sum of digits of a given number.
5. Write an SQL query to display all records from the `students` table.

PART-B

1. Write a Python program to find the sum of all values in a dictionary
   Do not use `sum()`.
2. Write a program to find the key with maximum value in a dictionary
   Do not use `max()`.
3. Write a program to remove a key from a dictionary if it exists.
4. Write a program to count the frequency of each character in a given string using a dictionary.
5. Flatten a 2D list using list comprehension.
   ```
   matrix = [[1, 2], [3, 4], [5, 6]]
   ```

PART -C

1. Write a Python program to print the first N prime numbers.
2. Write a Python program to find the nearest prime number to a given number.
3. Write an SQL query to find the second highest salary from the employees table (using sub query)
4. Write an SQL query to create a view that displays employees whose salary is greater than 50,000.
5. Write an SQL query to display all employees and their department names, even if some employees are not assigned to any department.
